STAT 3106: Problem Set 00 – Machines and Things

YOUR NAME HERE

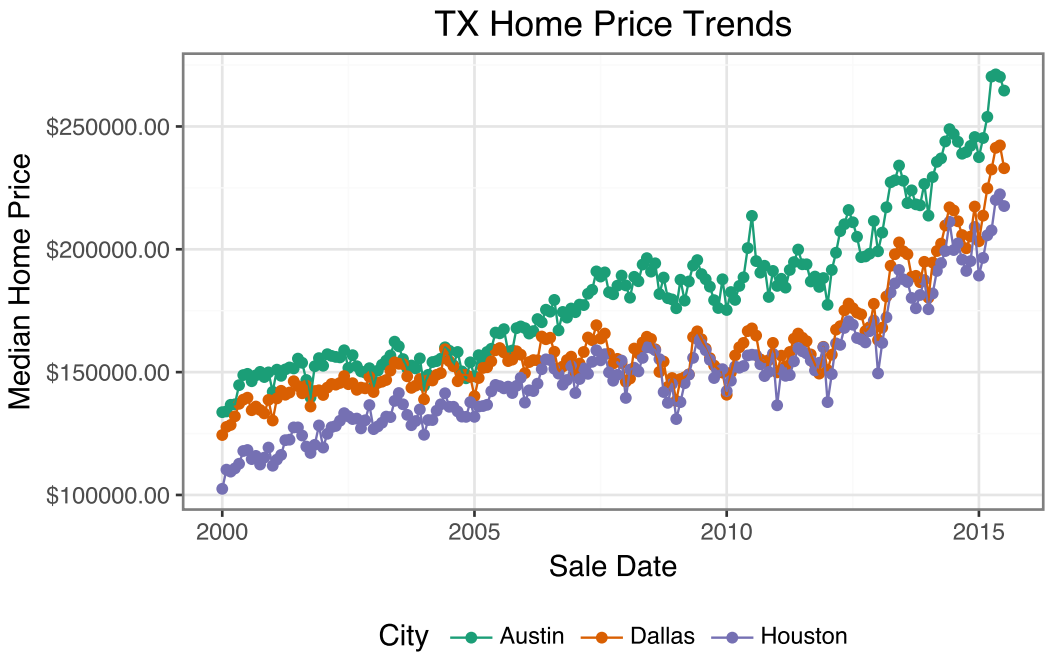

1 Question 1

Here is an example of some text, including this lovely plot:

```
from plotnine import *
from plotnine.data import txhousing
from mizani.formatters import currency_format

# Filter data
cities = ["Houston", "Dallas", "Austin"]
df = txhousing[txhousing["city"].isin(cities)]

# Plot
(
    ggplot(df, aes(x="date", y="median", color="city"))
    + geom_point()
    + geom_line()
    + theme_bw()
    + xlab("Sale Date")
    + ylab("Median Home Price")
    + scale_y_continuous(labels=currency_format(prefix="$"))
    + scale_color_brewer(type="qual", palette="Dark2", name="City")
    + theme(legend_position="bottom")
    + ggtitle("TX Home Price Trends")
)
```

In this figure, we see that things are getting more expensive and that Austin is generally more expensive than America's Greatest City, Houston.

Now that we're about to go to the next page, we need a page break.

2 Question 2

The answer to the second question goes here, where it highlights your brilliance and insight.

2.1 Part (a)

An apple alights atop an aardvark.

2.2 Part (b)

Brilliant beavers boldly build beautiful bluebird-bedecked bastions.
